Inter Facility Transfer Tool Kit

for the Pediatric Patient

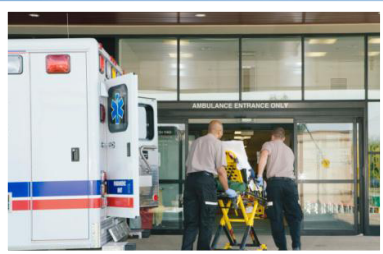

Moving a very sick or critically injured child from one facility to another is both complex and stressful to the child, family, and staff. Preplanned processes can reduce the strain of unfolding events, ensure that the handoff of the pediatric patient's care is smooth, and increase the safety of the transfer. This toolkit was designed to help ensure that hospitals and providers have the information and resources needed to better address these important processes.

Also available: **The Pediatric Regionalization of Care Primer** focuses on the evolution, essential components, and current models of regionalization, as well as the unique considerations in the development of a regionalized pediatric care system.
